

Application No. 10/700,083
Amendment Dated December 15, 2010
Reply to Office Action Dated August 16, 2010

Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (currently amended) A method for use in a first device to configure a second device to perform data synchronization with the first device in a directory assistance system, said method comprising the steps of:

storing at a directory assistance system personal contacts connection information in a folder associated with a user;

receiving a communication at said directory system from said user, wherein a profile including said folder associated with said user is identified by said system using a code identifying said user;

as part of said received communication, receiving a request for synchronization of a second set of personal contacts connection information from a personal information manager (PIM) of said user with said personal contacts connection information in said folder at said system associated with said user;

transmitting to the second device from a first device at said system, via a communication connection, instructions for generating a web-based user interface on the second device, said web-based user interface for use on said second device being the

Amendment Dated December 15, 2010
Reply to Office Action Dated August 16, 2010

same interface as used on said first device, the user interface being programmed to elicit from a user at the second device information identifying said ~~[[a]]~~ personal information manager (PIM) used on the second device, and to transmit the information to the first device at said system via the communication connection; and

providing to the second device via the communication connection a synchronization package based on the PIM-identifying information, the synchronization package including a synchronization application, the synchronization application being installed on the second device to be utilized via said web-based user interface, the web-based user interface also being programmed to elicit from the user synchronization information regarding data to be synchronized, and to provide the synchronization information to the synchronization application installed on the second device from said first device at said system.

2. (original) The method according to claim 1, wherein the synchronization information is provided to the synchronization application via a component object model (COM) interface.

3. (original) The method according to claim 1, wherein the PIM-identifying information is provided by the user.

4. (original) The method according to claim 1, wherein the PIM-identifying information

is determined by the user interface by detecting settings on the second device.

5. (original) The method according to claim 1, further comprising obtaining by the first device identifying information from the user.

6. (original) The method according to claim 1, wherein the synchronization information comprises folder names and locations.

7. (original) The method according to claim 1, wherein the synchronization information comprises synchronization direction and synchronization schedule.

8. (original) The method according to claim 1, wherein the first device is a server.

9. (original) The method according to claim 8, wherein the server is network-based.

10. (original) The method according to claim 9, wherein the network is the Internet.

11. (original) The method according to claim 9, wherein the network is a local area network.

12. (original) The method according to claim 9, wherein the network is the public

switched telephone network.

13. (original) The method according to claim 8, wherein the server is accessed through an information assistance service.

14. (original) The method according to claim 1, wherein the first and second devices are connected to each other.

15. (original) The method according to claim 1, wherein the first and second devices communicate with each other wirelessly.

16-21 (cancelled).

22. (currently amended) An apparatus at a directory assistance system for configuring a device to perform data synchronization with the apparatus, comprising:

A database at said directory assistance system for storing personal contacts connection information in a folder associated with a user;

An interface at said directory assistance system for receiving a communication at said directory system from said user, wherein a profile including said folder associated with said user is identified by said system using a code identifying said user, wherein as part of said received communication, receiving a request for synchronization of a second

set of personal contacts connection information from a personal information manager (PIM) of said user with said personal contacts connection information in said folder at said system associated with said user;

a communication interface for transmitting from the system to the device, via a communication connection, instructions for generating a web-based user interface on the device, said web-based user interface for use on said device being the same interface as used on said apparatus, the user interface being programmed to elicit from a user at the device information identifying [[a]] said personal information manager (PIM) used on the device, and to transmit the information to the apparatus at said system via the communication connection; and

a processor for providing to the device via the communication connection a synchronization package based on the PIM-identifying information, the synchronization package including a synchronization application, the synchronization application being installed on the device to be utilized via said web-based interface, the web-based user interface also being programmed to elicit from the user synchronization information regarding data to be synchronized, and to provide the synchronization information to the synchronization application installed on the device from said apparatus at said system.

23. (original) The apparatus according to claim 22, wherein the synchronization information is provided to the synchronization application via a component object model (COM) interface.

Reply to Office Action Dated August 16, 2010

24. (original) The apparatus according to claim 22, wherein the PIM-identifying information is provided by the user.

25. (original) The apparatus according to claim 22, wherein the PIM-identifying information is determined by the user interface by detecting settings on the device.

26. (original) The apparatus according to claim 22, wherein identifying information is obtained from the user.

27. (original) The apparatus according to claim 22, wherein the synchronization information comprises folder names and locations.

28. (original) The apparatus according to claim 22, wherein the synchronization information comprises synchronization direction and synchronization schedule.

29. (original) The apparatus according to claim 22, wherein the apparatus is a server.

30. (original) The apparatus according to claim 29, wherein the server is network-based.

31. (original) The apparatus according to claim 30, wherein the network is the Internet.

Application No. 10/700,083

Reply to Office Action Dated August 16, 2010

32. (original) The apparatus according to claim 30, wherein the network is a local area network.

33. (original) The apparatus according to claim 30, wherein the network is the public switched telephone network.

34. (original) The apparatus according to claim 29, wherein the server is accessed through an information assistance service.

35. (original) The apparatus according to claim 22, wherein the apparatus and the device are connected to each other.

36. (original) The apparatus according to claim 22, wherein the apparatus and the device communicate with each other wirelessly.
